It makes good dollars and sense.

Energy-curable ultraviolet solutions from Aetek UV Systems save you money and improve our world.

In today's environment, many companies are choosing energy-curable ultraviolet solutions, instead of either solvent or aqueous solutions, because it simply makes good sense. Here’s just a few reasons why:

- **They Make Good Business Sense**—Ultraviolet solutions are more energy efficient, which saves you money. They enable more productivity, because inks and adhesives don’t have to be cleaned up after each run. They’re more saleable to clients as a sustainable process. And they’re more environmentally compatible, because they lower VOCs, and do not generate large accumulations of waste chemistry that would otherwise need to be disposed of, properly, off site.

- **They Make Good Neighbor Sense**—Using ultraviolet to cure inks, coatings and adhesives is a more socially responsible process. Fewer components end up as waste, therefore allowing more components to be used, or at least recycled. Ultraviolet is less polluting, and this method of curing does not emit harmful bi-products into the air. In fact, there are no permitting costs for EPA measured discharges.

- **They Make Good Brand Sense**—Using ultraviolet often produces better looking finished products, simply because of the nature of the curing process. Many of our customers’ clients have told us the finished products they produce look better, are more saturated, and appear sharper. Of course this will enhance the image of your company brand, and help you pursue additional growth opportunities.

- **They Make Good Human Sense**—By conserving resources, and making better use of the components used in the ultraviolet curing process, all of us are lessening the waste we produce and keeping our air, water and land much cleaner. This makes for a better earth for all of us.

Please contact Aetek UV Systems today. And learn more about improving health; improving life; and improving business—it simply makes good sense.
